Branch: REC

Department: I AI & DS FA

Batch: 2028

Degree: B.E - AI & DS

## NeoColab\_REC\_CS23231\_DATA STRUCTURES

REC\_DS using C\_Week 5\_COD\_Question 3

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

#### 1. Problem Statement

You are required to implement basic operations on a Binary Search Tree (BST), like insertion and searching.

Insertion: Given a list of integers, construct a Binary Search Tree by repeatedly inserting each integer into the tree according to the rules of a BST.

Searching: Given an integer, search for its presence in the constructed Binary Search Tree. Print whether the integer is found or not.

Write a program to calculate this efficiently.

## **Input Format**

The first line of input consists of an integer n, representing the number of nodes

in the binary search tree.

The second line consists of the values of the nodes, separated by space as integers.

The third line consists of an integer representing, the value that is to be searched.

### **Output Format**

The output prints, "Value <value> is found in the tree." if the given value is present, otherwise it prints: "Value <value> is not found in the tree."

Refer to the sample output for formatting specifications.

```
Sample Test Case
```

```
Input: 7
    8 3 10 1 6 14 23
    Output: Value 6 is found in the tree.
    Answer
    // You are using GCC
    #include <stdio.h>
    #include <stdlib.h>
    // Define structure for a tree node
struct Node {
      int data:
      struct Node* left;
      struct Node* right;
    };
    // Function to create a new node
    struct Node* createNode(int data) {
      struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
      newNode->data = data:
      newNode->left = newNode->right = NULL;
      return newNode;
247987
```

```
241801022
    // Insert function for BST
    struct Node* insert(struct Node* root, int data) {
      if (root == NULL) {
        return createNode(data);
      if (data < root->data) {
        root->left = insert(root->left, data);
      } else {
        root->right = insert(root->right, data);
      return root;
    }
                                                                                   241801022
    // Search function for BST
    int search(struct Node* root, int key) {
      if (root == NULL) {
        return 0;
      if (root->data == key) {
         return 1;
      }
      if (key < root->data) {
        return search(root->left, key);
      } else {
        return search(root->right, key);
                                                                                   24,80,1022
                                                       24,180,102,2
int main() {
      int n, valueToSearch;
      scanf("%d", &n);
      struct Node* root = NULL;
      for (int i = 0; i < n; i++) {
        int val;
        scanf("%d", &val);
        root = insert(root, val);
      }
                                                                                   241801022
                                                       241801022
      scanf("%d", &valueToSearch);
      if (search(root, valueToSearch)) {
```

```
241801022
        printf("Value %d is found in the tree.", valueToSearch);
print } else {
         printf("Value %d is not found in the tree.", valueToSearch);
       return 0;
     }
     Status: Correct
                                                                      Marks: 10/10
